Why AMPM App

AMPM is not a public wedding-planning app where anyone can sign up and access the hotel database. It is a paid, client-based wedding management platform. Your public website is for attracting potential clients, explaining the platform, demonstrating its value, and converting interested clients into paying customers.
The most important distinction is that seeing AMPM, trying a limited demo, purchasing a subscription, and receiving full wedding-project access are four different stages.

1. The correct AMPM customer journey

Stage 1 — Public AMPM website
Open to everyone
Visitors can learn about AMPM, explore its services, understand the benefits, view selected previews, and request a consultation or demo. They do not receive the private app or full hotel database access.

Stage 2 — Demo or limited free trial
Prospective client
AMPM presents a demo video, guided demonstration, or a time-limited and restricted trial. The prospect can understand how the system works without receiving unrestricted access to real client projects or confidential data.

Stage 3 — Paid subscription
Access is purchased
Once the client is convinced, AMPM creates their account and grants access to the specific module or subscription package they have purchased. Access depends on their plan and permissions.

Stage 4 — Wedding project creation
When the client decides to proceed with the wedding management service, AMPM creates the client's wedding project in the system, configures the relevant modules, and adds the wedding-specific information, team members, budget, venues, guests, vendors and other details.

Stage 5 — Full authorised access
The client and their authorised AMPM team members use the full set of modules included in the agreed service or plan. The platform retains access controls, confidential information, approvals and project-specific permissions.
One important distinction for the developer: paying for an app subscription does not automatically mean that a client has purchased AMPM's complete wedding planning and execution service. Those can be separate commercial offerings, even if they work together.

2. How the developer should build AMPM
The system should have three distinct environments, not one public app with open registration.

Environment	Who can access it?	What they can do
Public website	Anyone	Learn about AMPM, view marketing content, request a demo
Demo / trial environment	Approved prospects	Explore selected features with sample data or limited permissions
Private AMPM platform	Accounts authorised by AMPM	Access purchased modules, private hotel data and authorised wedding projects

3. How the hotel discovery feature fits into this model
The hotel database is a private AMPM resource, not a public directory.

- Public visitors can see selected examples, screenshots or a preview of the hotel discovery feature.
- During a demo or trial, prospects can explore the feature using sample data or specifically limited access.
- After purchasing the relevant subscription, an authorised client can access the hotel discovery module according to their plan.
- AMPM can help the client shortlist hotels, compare costs and assess suitability for their wedding.
- Once the wedding project is formally created, hotel selections and relevant information can be connected to that specific wedding.

4. The access-control rules

The developer should implement these rules from the beginning:

- No public self-registration for the private platform.
- AMPM administrators create or approve client accounts.
- Each account receives only the modules included in its subscription.
- A paid module subscription and a full wedding-management engagement are tracked separately.
- Full wedding-project access is activated only after the required commercial approval and onboarding.
- Each wedding is a separate project with its own budget, guests, vendors, documents, approvals and permissions.
- Demo data must remain separate from real client data.
- Subscription expiry, cancellation and upgrades must control access appropriately without accidentally deleting wedding records.

AMPM as a private, subscription-based wedding management platform with a public marketing website and a controlled demo-to-client onboarding funnel. This protects your proprietary database and makes your software a paid business asset rather than a free public tool.
