AMPM MANAGEMENT
Final App Decision Brief & Developer Requirements

Document: Consolidated Business Decisions — Part 2 and Complete System Requirements
Company: AMPM Management Pvt. Ltd.
Purpose: Development planning, system architecture, feature design, access control, and acceptance testing.

———

1. PROJECT OVERVIEW

AMPM is developing a private wedding management platform for its own team and clients. It will manage hotel discovery, wedding planning, vendors, guests, budgets, approvals, hospitality, and wedding-day operations.
The system must support four connected experiences:

1. **Public Website** — company information, enquiries, and demo requests.
2. **Hotel Discovery Portal** — a paid, time-limited subscription for clients exploring wedding hotels.
3. **Client Wedding Portal** — available only to clients who appoint AMPM for complete wedding planning and management.
4. **AMPM Team App** — internal management of clients, hotels, vendors, guests, hospitality, and wedding-day departments.

The platform is intended for AMPM's internal business use, not for licensing to other wedding planners.

Core business rule

Hotel discovery and complete wedding management are two separate services.

- A client can purchase hotel discovery without appointing AMPM for the entire wedding.
- Purchasing hotel discovery does not automatically unlock vendor selection or wedding management.
- Full wedding planning access is enabled only after the client and AMPM mutually agree to proceed with wedding management.
- AMPM decides its wedding management fee separately. This fee is not calculated or displayed as part of the hotel discovery subscription.
- All internal costs, margins, vendor quotations, and negotiation details remain private.

2. CLIENT JOURNEY: ENQUIRY TO WEDDING MANAGEMENT

Stage 1 — Enquiry and demo

1. A prospective client submits an enquiry through the AMPM website or contacts the AMPM team.
2. Nobody can independently register for a full account.
3. AMPM reviews the enquiry and authorises access to a demo.
4. The client logs in using their mobile number and OTP verification.
5. The demo is accessible only after successful verification.
6. The demo provides limited hotel information and sample pricing, not unrestricted access to the full database.
7. The client can request a 15–20-minute Zoom call with AMPM before purchasing the subscription.

Demo restrictions:

- The demo is provided and controlled by AMPM.

- The demo is limited to selected hotels and locations.
- The proposed demo allows up to three locations, with street-view information where available.
- The demo can show up to two sample hotels with indicative prices.
- The exact number of hotels, cities, and demo duration must be finalised with the AMPM team before development.
- Demo access does not unlock the complete hotel database or wedding management modules.

Stage 2 — Account creation and subscription

Once the client decides to purchase hotel discovery:

1. AMPM either creates the client's account or sends an invitation link.
2. The client completes the basic wedding details, including the couple's names, contact information, tentative dates, and preferred locations.
3. The client pays the hotel discovery subscription fee through the portal.
4. The system activates hotel discovery after successful payment confirmation.
5. The client can explore the permitted hotel information and save hotels.

AMPM must be able to create accounts, send invitations, manage demo access, and activate or suspend subscriptions.

Stage 3 — Hotel discovery subscription

The client can explore available hotel information, compare options, save favourites, and submit enquiries.

The hotel discovery subscription is a separate paid service and does not include complete wedding planning or vendor selection.

Stage 4 — Appointment of AMPM for the wedding

If the client decides to appoint AMPM for the complete wedding:

1. AMPM and the client mutually confirm the wedding management arrangement.
2. AMPM determines the wedding management fee separately.
3. The agreement is recorded by the AMPM team.
4. AMPM creates the wedding project and activates the relevant client and team modules.
5. The client receives access to the applicable wedding planning features, including vendor selection, budgets, design approvals, hospitality, and other agreed services.

The system must not unlock the full wedding project simply because a client has purchased hotel discovery.

3. HOTEL DISCOVERY SUBSCRIPTION

Subscription price and duration

Item	Business decision
Subscription fee	₹50,000
Payment type	One-time payment
Subscription duration	One month
Purpose	Hotel discovery portal
Renewal	Client may continue by purchasing another subscription
Access after expiry	Read-only access to saved hotel names and existing enquiries

Data deletion	No automatic deletion of saved hotels or enquiry history

The subscription duration is one month from activation.
When the subscription expires:
- The client cannot continue using the active hotel discovery features.
- Saved hotel names remain accessible.
- Existing enquiries remain available in read-only mode.
- No information is automatically deleted.
- When the client renews the subscription, the existing saved hotels and enquiry information become available again, along with the active discovery features.

The ₹50,000 subscription fee must be configurable by AMPM through settings rather than permanently hard-coded into the software.

Payment method

The client pays online using the supported payment gateway, with card and UPI payment options.
The payment system must:
- Generate a payment record.
- Record the amount, date, status, and transaction reference.
- Activate the subscription after successful payment confirmation.
- Prevent duplicate activation from repeated payment notifications.
- Show the subscription start date and expiry date.
- Allow authorised AMPM staff to review payment status.

The payment gateway provider will be selected by AMPM.

4. HOTEL DISCOVERY FEATURES

The hotel discovery portal is the main feature of the subscription.

Hotel listing and details

Clients should be able to explore hotels using a clean, visual interface.
Each hotel profile should support:
- Hotel name, city, and location.
- Property photographs and videos.
- Available wedding venues and venue photographs.
- Room categories and room photographs.
- Approximate room pricing.
- Wedding package price ranges.
- Indicative venue rental pricing.
- Food and menu information presented in a grid or structured layout.
- Vegetarian and non-vegetarian menu information, where available.
- Approximate per-plate pricing, where available.
- Guest accommodation capacity and relevant facilities.
- Street View or map-based location information, where available.
- Saved hotels and favourites.
- Enquiry submission.
- Availability-check requests.
- Previous wedding photographs only when AMPM has the necessary permission to display them.

The purpose is to help clients understand a hotel's suitability and approximate cost before proceeding with further discussions.

Pricing rules

The portal displays indicative prices and price ranges, not AMPM's internal cost or margin.
- Clients see approximate room, venue, food, and wedding package pricing where available.
- Prices may vary by season, dates, guest count, room category, and hotel terms.
- Prices must include a last-verified date wherever appropriate.
- The portal must distinguish indicative pricing from confirmed quotations.

- Actual availability is not assumed from the displayed price.
- AMPM can update prices and hotel information without requiring a developer to change the code.

Hotel availability

The system does not need to maintain an automated, live hotel availability calendar in the first release.
Instead:
1. The client selects a hotel and submits an availability request or adds it to the enquiry/cart.
2. The request is sent to the AMPM team.
3. The hotel team checks availability with the property.
4. The team records the response and shares the update with the client.
5. The client can compare the response with other saved hotels.

The portal must clearly indicate whether information is indicative, requested, verified, or awaiting confirmation.

Hotel data management

Eva will help maintain the existing hotel data and update rates seasonally, approximately three times per year as a working target.
The AMPM team must be able to:
- Add and edit hotels.
- Import hotel information from spreadsheets.
- Update prices and package information.
- Upload and manage photographs and menus.
- Record the date and person responsible for verifying prices.
- Mark information as outdated when appropriate.
- Manage permissions for photographs and videos.

AMPM will control the display of hotel photographs and other content. Previous clients' wedding photographs must not be published without appropriate permission.

5. CLIENT PORTAL ACCESS AND APPROVALS

Authorised family representatives

Once the wedding management arrangement is confirmed, the family decides who will be responsible for using the client portal.
Only two nominated family representatives are permitted:
- One representative from the bride's side.
- One representative from the groom's side.

The family can decide which individuals will take responsibility for these roles.
The portal must not allow additional family members to create independent client accounts without AMPM's authorisation.
The intended business arrangement is for these two representatives to share responsibility for the wedding portal. The precise login implementation—one shared login or two individually authenticated accounts with access to the same wedding—must be finalised before development. Separate authenticated accounts are preferable for security and audit history.

Client permissions

The client portal allows authorised representatives to view wedding updates, hotel information, selected vendor profiles, proposals, designs, and approvals applicable to their wedding.
They may submit change requests and communicate with AMPM through the portal.
However:
- They cannot directly edit the RSVP guest list or individual guest responses.
- They cannot access AMPM's internal costs or margins.

- They cannot see private vendor negotiation details.
- They cannot access other weddings or other families' private information.
- Changes to approved items must follow the formal change-request and approval process.

AMPM can record decisions made by the family outside the portal, provided the authorised team member attaches a note or supporting record.

6. VENDOR SELECTION AND COMMERCIAL PRIVACY

When vendor selection becomes available

The vendor selection section remains locked during hotel discovery.
It becomes available only after the client has appointed AMPM for complete wedding planning and the wedding project has been activated.

Vendor options

For each applicable service category, AMPM can present approximately five to ten suitable vendor options based on the client's budget, expectations, service requirements, and the nature of the wedding.
The number five to ten is a guideline, not a mandatory software restriction.
Vendor categories may include:

- Photography and videography.
- Decor and production.
- Catering.
- Entertainment and artists.
- Makeup and styling.
- Transport and logistics.
- Other services relevant to the wedding.

The exact categories depend on AMPM's service structure.

Vendor information visible to clients

Clients may view the vendor's approved profile, portfolio, service description, relevant photographs, and other information AMPM chooses to share.
Vendor selection should support:

- Viewing vendor options.
- Comparing profiles.
- Saving or shortlisting options.
- Selecting a preferred vendor.
- Submitting a selection for approval.
- Reviewing AMPM's response.
- Requesting changes through the portal.

Commercial privacy rule:
Vendor rates, internal quotations, negotiated amounts, internal costs, commissions, margins, and private negotiations must not be displayed to the client.
Vendor contact information should remain internal by default. AMPM can decide separately whether specific contact information is shared in an approved case.
The system must never expose internal commercial data through client-facing screens, exports, notifications, or APIs.

7. FINANCIAL INFORMATION AND WEDDING MANAGEMENT FEES

The hotel discovery subscription fee is ₹50,000 for one month.
The fee for complete wedding planning and management is determined separately by AMPM after the client agrees to appoint the company.

The app must not automatically calculate the wedding management fee from the hotel discovery subscription.
For the client-facing wedding portal:
- Display only information approved for the client.
- Do not display internal costs or margins.
- Do not display vendor quotations or private negotiation records.
- Do not display AMPM's internal profit calculations.
- Keep internal commercial records accessible only to authorised AMPM personnel.

The first release does not require online collection of wedding management milestone payments unless AMPM separately approves this feature.

8. RSVP, GUEST MANAGEMENT AND PRIVACY

Guest invitation links

AMPM must be able to create separate guest invitation links for the bride's side and groom's side.
A single combined wedding link may also be supported where AMPM chooses to use it.
For separate bride-side and groom-side lists:
- Each side must remain private.
- Guests must not see the other side's guest details.
- A guest must not be able to reopen or browse the entire guest list after submitting their RSVP.
- Guests must not be able to view another household's information.

Each guest invitation link should lead to the relevant RSVP form without exposing unrelated guest records.

Guest RSVP process

The guest process should work as follows:
1. AMPM imports or creates the guest list.
2. The team sends the relevant invitation links.
3. Guests confirm attendance and provide the requested information.
4. The RSVP system records each response.
5. The authorised AMPM RSVP team reviews and updates the guest records.
6. If a guest needs to correct a response, they submit a change request or contact request.
7. The request is routed to the RSVP caller/team for follow-up.

Guests should not receive direct editing access to the full guest list after submission.

Client access to RSVP information

The two authorised family representatives can view approved guest updates and relevant summaries in the client portal.
They cannot directly edit the RSVP list or change individual guest responses.
Any correction or change must be routed through the RSVP team.

Guest data fields

The RSVP system should support:
- Guest name.
- Household or family grouping.
- Bride-side or groom-side classification.
- Attendance status.
- Number of attending guests.
- Relevant meal preference.
- Allergies, where required.
- Rooming and accommodation information, where applicable.
- Travel information, where applicable.
- Change-request status.

Each guest must be counted individually even when guests belong to the same household.
Children must be included in headcounts and relevant rooming or meal information.

Identity documents

Identity documents should not be compulsory for every wedding.
Where a hotel requires documents for check-in, AMPM may enable the relevant collection process for that wedding.
The system must:

- Restrict document access to authorised staff.
- Avoid collecting Aadhaar documents or numbers.
- Keep sensitive documents in restricted storage.
- Follow AMPM-approved retention and deletion policies.

The final retention period and privacy wording must be confirmed by AMPM before launch.

9. AMPM TEAM APP AND DEPARTMENT ACCESS

The AMPM team needs a separate internal workspace.
Every staff member logs in using their authorised account. Access is controlled by role and department.
A department manager using the app on a mobile phone must only see and update the sections relevant to their assigned work.
For example:

- The hotel team manages hotel information and availability enquiries.
- The vendor team manages vendor profiles and selection records.
- The RSVP team manages guest lists and guest-response requests.
- The hospitality team manages accommodation and guest arrangements.
- The production team manages event readiness, cue sheets, and production tasks.
- The project manager oversees the wedding project and its approved operational information.
- Senior authorised management oversees access, exceptions, and system settings.

These are functional examples. The final role list and permissions must follow AMPM's approved staff structure.

Important permission rules

- Staff must not automatically receive access to every wedding department.
- Internal financial information must be restricted to specifically authorised personnel.
- Vendor costs and hotel costs must not be visible to unauthorised users.
- All significant updates and approvals should be recorded against the responsible user.
- Changes to an approved item must create a new version and require approval where applicable.

10. WEDDING-DAY OPERATIONS AND OFFLINE ACCESS

Offline access is required because some wedding venues may have poor mobile network coverage.
The app must support iOS and Android use, including access to essential operational information when the device is offline.

Offline functionality

Authorised staff should be able to access relevant information already downloaded to their device, including:

- Assigned tasks.
- Department-specific information.

• Readiness checklists.
• Cue sheets.
• Arrival and operational lists relevant to their role.

Where supported, staff should be able to record operational updates offline.

When the device reconnects to the internet, the app must synchronise those changes with the central system.

The system should:

• Indicate when the device is offline.
• Show whether changes are pending synchronisation.
• Avoid silently losing updates.
• Detect conflicting changes and provide a controlled resolution process.
• Prevent unauthorised access to locally stored information.

Offline access must be limited to the information needed for the user's assigned role.

Readiness checks

A wedding function must not be marked ready when required checks remain incomplete unless an authorised manager records an exception.

Only Eva is authorised to approve operational exceptions under the current business decision.

The system must record:

• The unmet check.
• The exception and reason.
• The authorised person.
• The date and time.
• The resulting approval status.

The exception authority must be configurable, but only Eva's authorised personnel may exercise it under the approved policy.

Closure

After the wedding, the system should support:

• Completion of departmental checklists.
• Vendor completion confirmation.
• Final guest and operational reconciliation.
• Lost-and-found checks.
• Final account records and approvals.
• Feedback collection.
• Archiving of the wedding project.

11. POST-WEDDING ACCESS AND ARCHIVING

The client's wedding portal remains available in read-only mode for **three months after the wedding**, as per the updated AMPM decision.

During this period, the client can review the retained wedding information but cannot make direct changes to completed records.

After the three-month period:

• The wedding project is archived following AMPM's approval.
• The project remains available to authorised AMPM personnel.
• Records are not automatically deleted.
• Client access follows AMPM's approved post-wedding access policy.
• Any later access or reopening is controlled by AMPM.

The developer must implement archiving as a change in status and access permissions, not as deletion of the wedding data.

12. QUESTIONS, MESSAGES AND CHANGE REQUESTS

The portal must support both tracked requests and a live chat option.

Tracked requests

Clients can submit requests related to:

- Hotel enquiries.
- Wedding arrangements.
- Vendor selection.
- Designs and menus.
- Guest-related assistance.
- Changes to approved information.
- General support.

Each request should have a status such as:

- Submitted.
- Under review.
- Accepted.
- Rejected.
- Implemented.
- Closed.

A conversation history must be maintained against each tracked request.

Live chat

A live chat option is also required.

The home page should provide access to the relevant help and communication options. The initial home page structure is acceptable for the first release and can be expanded later.

Live chat must be distinguished from tracked requests so that a conversation can be handled immediately while a formal change request retains its own approval history.

Change requests

Clients cannot directly alter approved items.

A client submits a change request. AMPM reviews it and accepts or rejects it. If an approved item changes, the system creates a new version and records the approval of that version.

13. WEBSITE AND APPLICATION REQUIREMENTS

Application platforms

AMPM requires applications for:

- iOS.
- Android.

Offline operational use is required for the wedding day, with automatic synchronisation when connectivity returns.

The final technical architecture should be agreed with the development team to support these requirements.

Public website

The public website provides:

- AMPM information and services.
- Enquiry submission.
- Demo requests.
- Contact details.

• Appropriate login and invitation entry points.

AMPM staff will not have permission to edit public website content through the app in the initial scope.

Website content management and the public website editor described in the original decision brief are not approved for the current release.

Login and authentication

For prospects and demo users:
• Mobile number.
• OTP verification.
• No unrestricted self-registration for full access.

For clients:
• Access through an AMPM-created account or invitation.
• Mobile OTP verification as the intended login method.
• Access limited to the authorised wedding.

For staff:
• Individual authorised accounts.
• Role-based and department-based access.
• Appropriate authentication and account security.

The exact authentication method for staff should be finalised with the development team.

14. SYSTEM CONFIGURATION AND DATA SECURITY

AMPM must be able to configure commercial settings without developer intervention.

These should include:
• Hotel discovery subscription price.
• Subscription duration.
• Demo limits.
• Hotel categories.
• Vendor categories.
• Pricing thresholds.
• Change-request rules.
• Relevant access and approval settings.

The system should not rely on hard-coded commercial rules.

Security requirements

The system must:
• Protect client, guest, hotel, vendor, and financial data.
• Keep internal costs and margins private.
• Enforce permissions on the server, not just hide information in the interface.
• Maintain appropriate audit records.
• Provide reliable backups and recovery.
• Protect sensitive information stored for offline access.
• Prevent one wedding's users from accessing another wedding's records.

AMPM will approve the hosting arrangements, retention policies, privacy wording, and recovery targets with the development team before launch.

15. QUESTIONS FROM THE ORIGINAL DECISION BRIEF — FINAL ANSWERS

Question	AMPM decision

Q1 — Website or app?	iOS and Android applications are required. Offline access for essential wedding-day operations and automatic synchronisation are required.
Q2 — How do clients pay?	Online payment using supported card and UPI options.
Q3 — What is the subscription?	One-time ₹50,000 fee for one month of hotel discovery.
Q4 — How does AMPM earn?	Hotel discovery is a separate service. Wedding management fees are decided separately by AMPM. Internal costs and margins are never shown to clients.
Q5 — Who logs in and approves?	Two nominated family representatives: one from the bride's side and one from the groom's side. They can decide who takes responsibility.
Q6 — Who sees costs and margins?	Internal costs, margins, vendor rates, and private negotiations must not be displayed to clients. Access within AMPM is restricted to authorised staff.
Q7 — How do guests RSVP?	Bride-side and groom-side links, or a single combined link when required. Guests cannot access or edit the complete guest list.
Q8 — Identity documents?	Only when required for a wedding or hotel check-in, with restricted access and an approved retention policy. Never collect Aadhaar documents or numbers.
Q9 — Hotel data and prices?	Eva helps update hotel information and seasonal prices, with a working target of approximately three updates per year. AMPM controls permissions for displaying hotel photographs. Availability is checked by the team on request.
Q10 — What is in the first release?	Demo and subscription-based hotel discovery, wedding management after appointment, vendor selection, client portal, department-based team access, RSVP, tracked requests, live chat, and offline wedding-day operations. Only Eva can authorise exceptions.

16. REMAINING QUESTIONS — Q11 TO Q25

Question	**Decision or implementation note**
Q11 — Client and guest communication	Email, WhatsApp and SMS are the proposed channels. Final implementation and provider selection remain to be confirmed.
Q12 — Public website editing	Not permitted for AMPM staff in the current release.
Q13 — Sign-in	Mobile number and OTP for prospects and clients; authorised individual accounts for staff.
Q14 — Hosting and recovery	Hosting region, backups, and recovery targets to be finalised with the developer.

Q15 — Expected scale	Initial planning assumption: approximately 20 concurrent weddings and up to 200 hotels. Confirm the required staff and guest capacity before implementation.
Q16 — Currency and language	INR and English. GST invoices are not to be generated by the platform in the current scope.
Q17 — Privacy and retention	AMPM will approve the final privacy wording and data-retention policy. Wedding records are not automatically deleted.
Q18 — Multiple hotels and venues	The data model should support a wedding involving multiple hotels or venues.
Q19 — Room blocks and rooming	Support hotel-, category-, and date-based room allocation, with guest counts including children. Room bookings are not automatically made by the app.
Q20 — Questions and messages	Both tracked requests with conversation history and live chat are required.
Q21 — Change requests	Formal submission, review, acceptance/ rejection, implementation, and versioned approval.
Q22 — Vendor or hotel logins	Not required in the current project.
Q23 — Post-wedding access	Read-only access for three months after the wedding, then archive following AMPM approval.
Q24 — Feedback and archive	Feedback form and archived project records are required.
Q25 — Material changes	Change thresholds must be configurable. AMPM will define the final thresholds and approval rules.

17. IMPORTANT BUSINESS RULES TO PRESERVE

The following rules are mandatory for the development team:

1. No unrestricted self-registration.
2. AMPM controls demo access and account invitations.
3. Hotel discovery is a paid subscription separate from wedding management.
4. The hotel discovery subscription is ₹50,000 for one month.
5. Expiry must not automatically delete saved hotels or enquiry history.
6. Full wedding management access is activated only after the client appoints AMPM.
7. Vendor selection is unavailable to hotel-discovery-only subscribers.
8. Internal costs, margins, vendor rates, and negotiations are not shown to clients.
9. Only two nominated family representatives can access the client wedding portal.
10. Guests cannot access other families' information or edit the master RSVP list.
11. Department managers can access only the areas relevant to their work.
12. Offline wedding-day updates must synchronise when connectivity returns.
13. Only Eva can authorise operational exceptions under the current policy.
14. Live chat and tracked requests are both required.
15. No public website editing through the app in the initial release.
16. Post-wedding access is read-only for three months, followed by archiving with AMPM approval.
17. Important commercial settings must be configurable without changing application code.
18. All access restrictions must be enforced by the backend, not merely by the user interface.

18. ITEMS TO CONFIRM BEFORE DEVELOPMENT

The business workflow above is defined, but the following implementation details need final confirmation:

- Exact demo duration and final hotel/location limits.
- Whether the demo will show one or two sample hotels with indicative prices.
- Payment gateway provider and transaction-handling requirements.
- Whether the two family representatives will share one login or have separate authenticated accounts.
- Final staff roles and which internal users may access hotel costs or vendor costs.
- Hosting provider, backup location, and recovery targets.
- Initial capacity for staff, hotels, weddings, and guests.
- Communication provider for WhatsApp and SMS.
- Privacy wording and retention periods for leads, guest records, and identity documents.
- Final material-change thresholds and approval rules.
- The exact workflow for archiving projects and restoring access after archiving.

These points should be documented in the technical specification before development begins.

19. DEVELOPER ACCEPTANCE CHECKLIST

The first release should not be approved until the following scenarios pass testing:

- A prospect cannot access the full hotel database without AMPM-authorised access.
- A verified demo user sees only the permitted demo information.
- A client can purchase the ₹50,000 hotel discovery subscription online.
- Successful payment activates the one-month subscription.
- Expiry changes access appropriately without deleting saved hotels or enquiries.
- Renewal restores active discovery access and preserves previous data.
- A hotel-discovery-only subscriber cannot access vendor selection.
- AMPM can activate wedding management after the client appoints the company.
- Client screens and APIs never reveal internal costs, margins, or private vendor rates.
- Only authorised family representatives can access the client wedding portal.
- Guests cannot access another household's information or edit the master RSVP list.
- Department managers cannot access unrelated departments.
- Essential operational information remains accessible offline.
- Offline updates synchronise when connectivity returns.
- An incomplete readiness check cannot be bypassed without an authorised exception.
- Both tracked requests and live chat work as intended.
- Approved changes create a new version and follow the approval workflow.
- Wedding access becomes read-only after three months and archiving follows AMPM approval.
- Archived data is retained according to AMPM's approved policy.
- Public website editing is unavailable to AMPM staff in the current release.

———

Final instruction to the development team: Build the system around AMPM's actual business workflow. Hotel discovery must work as an independent paid service, while full wedding planning and vendor management remain exclusive to clients who appoint AMPM. Maintain strict separation between client-facing information and internal commercial data, and ensure that all permissions, subscription rules, approvals, and retention policies are enforced by the system.

My recommendation before you send this to your developer

Three things deserve particular attention:

- Client login: Two family representatives can have access to the same wedding, but separate logins with the same wedding permissions will be safer and will give AMPM an audit trail of who approved each decision.(bride &groom side RSVP data)

- Hotel demo: Your notes mention both one hotel per city and two sample hotels. Finalise the exact limit with your team before the developer builds the demo.
- Offline access: Ask the developer to demonstrate offline changes being saved and synchronised after reconnecting, not just screens that remain visible without internet.
